

Steroid A-ring orientation: native progesterone is correct; testosterone cannot be steered to it

A WT · progesterone (native, SAR-CORRECT)

3-keto → R123 = 3.1 Å ✓ recognition code holds

B des0039 · testosterone (3-keto→R123 constraint + steering potentials)

3-keto → R123 = 12.3 Å ✗ STILL FLIPPED — Boltz won't re-orient even when steered

Ligand=yellow · pocket residues (≤ 4.5 Å)=pale-cyan · design mutations=orange* · H-bonds=red dashes · MODEL numbering. Conclusion: de-novo orientation for test/cort is a model artifact, unfixable by contact constraints (even with --use_potentials).
